

MESI mTABLET

Going wireless saves lives

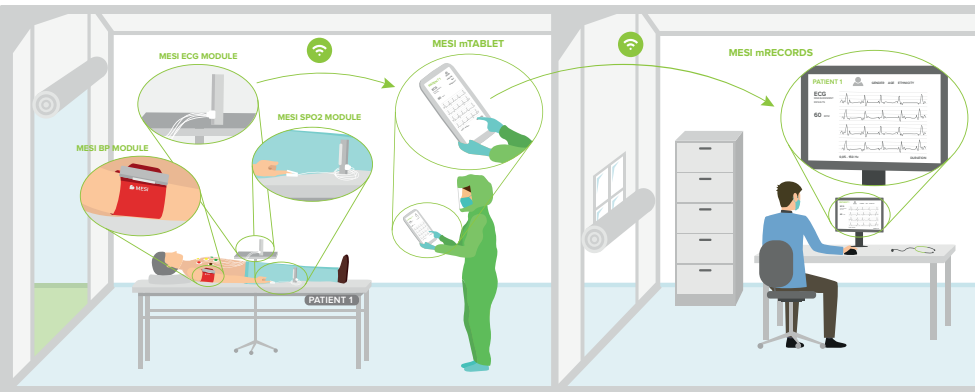

- Wireless diagnostic and monitoring devices
- Quick ECG measurement
- Oxygen saturation and blood pressure monitoring
- All data in one location
- Easy disinfection

COVID-19 and MESI mTABLET

COVID-19 is affecting healthcare systems around the world and posing new challenges for healthcare providers and patients alike. MESI mTABLET wireless modules solve those caused by the proximity between a patient and a healthcare worker:

COMPLETE PRE-ADMISSION TRIAGE

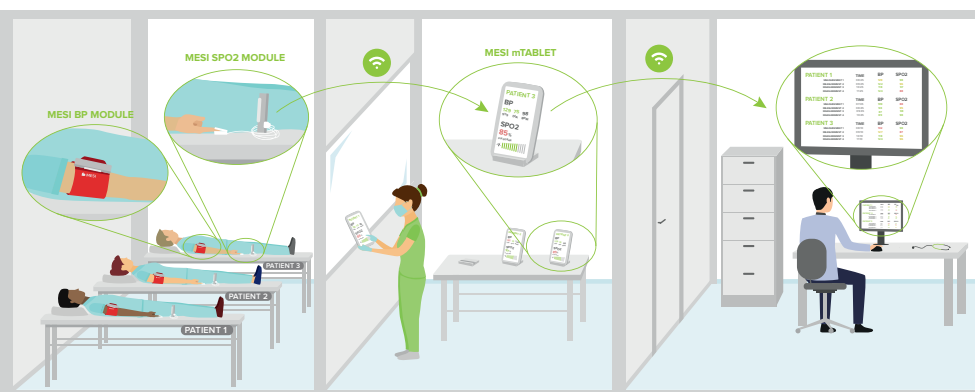

Perform a quick ECG measurement to detect potential heart irregularities.

Perform a single BP measurement with pulse waveform analysis in 1 minute.

Quickly assess the patients' oxygen levels.

WIRELESS PATIENT MONITORING

Continuously monitor the patients' oxygen saturation levels and blood pressure from a safe distance.

Inspect real-time data of multiple patients simultaneously on one PC screen.

The built-in alarm on the mTABLET alerts you in case there is a drop in oxygen level.

CONNECTED HOMECARE

During home visits, take the vital signs and instantly connect with the consulting doctor for further guidance with the treatment.

By using digital question forms on the mTABLET, each home visit becomes standardized, well documented and the level of care unified.
